

GINA DALY

School of Clinical Therapies

Course Attended:

Research Mentorship Program, The STAR Institute for Sensory Processing Disorder, Denver, USA
1st-3rd May 2019

The purpose of attending this course was to increase my knowledge around single subject designs as a research methodology for the purpose of my PhD research in the area of sensory integration and children with ASD. My knowledge around this type of research methodology has been greatly enhanced and I now have a greater understanding in how to apply this to my own research project. I had the opportunity to work alongside experts in the field of SI research as well as being offered follow-up mentorship. Intervention research as a sole clinician is very daunting and challenging and finding a suitable course to support my needs was very difficult. This is the only course that is tailored to practitioners who are looking to translate their skills into clinical research. This has helped me to build and strengthen my research design for my PhD.
