Executive Summary

This survey focuses on a deep-water coral-dominated canyon system, the Porcupine Bank Canyon, NE Atlantic. Both cold water corals (CWC's) and submarine canyons have received considerable attention in recent years both from the general public and in deep-water scientific research. CWC's generate three-dimensional, structural habitats that form hot spots of biodiversity on continental margins and record changes in our environment. The primary objectives of the survey are to: a) acquire multi-resolution seabed mapping data; b) acquire precision core material from a variety of coral habitats; c) image the full spectrum of coral habitats within the canyon and; collect water and bio-samples at strategic locations throughout the canyon.

Previous mapping data of the canyon carried out by the Irish National Seabed Survey (1999 - 2006) is of too low a resolution (>25 m) to image the coral habitats throughout the canyon. Here, we have remapped the canyon at several resolutions to assess the distribution of these habitats as well as the sedimentological processes acting upon them. High-resolution ROV-multibeam also revealed the distribution of slope deposits and potential processes by which sediments can be transported into the basin from the canyon flank.

A transect of ROV-guided vibro cores were collected along the canyon lip where there is a gradation from coral mounds to coral gardens. A second transect of cores were collected from the deep basin, the pro-slope and up the canyon face. The retrieved core material will be subjected to a series of multiproxy analytical techniques (UCC) to assess the role of canyon processes on coral habitat development through time.

Bio-samples and video were collected as a cross-transect (deep canyon to canyon lip). Video shows that the canyon lip to the southeast hosts very large coral reefs with evidence of Wilson rings (Wilson, 1979), a phenomenon that has rarely been reported. This data will feed directly into a project (UCC) which assess the spatial patterns of coral habitats within the canyon and their responses to environmental parameters on a local-scale.

Water samples have been collected by the ROV and CTD rosette at a number of water depths, in particular, around the coral habitable zone (-600 m to -1000 m). These samples have been treated and stored for analysis of Particulate Organic Matter (UCC) and the effects of Ocean Acidification (NUIG) on coral habitats.

Background

Cold-water coral habitats are important centres of biodiversity in deep-seas that are subject to international conservation efforts including designation as Special Areas of Conservation in Irish waters. However, despite their significance we have a limited understanding of how these reefs grow and respond to changes in environmental conditions, although research shows they are strongly influenced by abiotic (allogenic) factors (Roberts *et al.*, 2009; Wheeler *et al.*, 2007; Lim *et al.*, 2018; Mienis *et al.*, 2007). In order to manage these systems, we must understand their natural dynamics and vulnerability to environmental pressures. Recent work on the Irish Porcupine Bank Canyon (PBC), a natural laboratory isolated from terrigenous input, has revealed extensive speciose, high biomass cold-water coral (CWC) structural habitats protected under the EU Habitats Directive (Wheeler and shipboard party, 2015; 2016).

Data from this survey feeds directly into a UCC Marine Geology Research Group, SFI-, GSI- and MI-funded project entitled Mapping, Modelling and Monitoring Key Controls and Processes on cold water coral habitats in Submarine Canyons (MMMonKey_Pro). The project aims to explore and monitor the PBC-CWC habitats and relate to ocean-climate environmental dynamics. For this, we require ROV-based multibeam bathymetry and novel 3D photogrammetric approaches for geostatistical analysis (collected during CoCoHaCa I, 2017) and habitat characterisation. Monitoring of canyon hydrodynamic and sedimentary processes, and core analysis will reveal the process thresholds defining coral sub-habitats' limits, in space and time, and allow predictive CWC, and habitat sensitivity, models to assist marine spatial planning. By assessing the magnitude of existing anthropogenic impacts within the constraints of the sensitivity model, recommendations can be extrapolated from the data for sustainable, responsible intervention in these habitats for fisheries and hydrocarbon exploration. Likewise, process thresholds will reveal the potential impact-response from climate change facilitating knowledge-based recommendations for effective management. This project adds to Irish seabed mapping capacity, develops a critical mass to generate large consortia, building further capacity and relationships with industrial (hydrocarbon)/international partners.

MMMonKey_Pro adopts a habitat-approach based study of the upper Porcupine Bank Canyon in order to understand the controls on the biodiverse and high biomass cold-water coral habitat that flourishes there. This habitat has a major impact on canyon-wide processes and is itself controlled by canyon hydrodynamics. Understanding the interaction between canyon abiotic controls and ecosystem response will better allow us to responsibly interact with this valued ecosystem and enact effective management policies within a changing world.

VOCAB (Ocean Acidification and Biogeochemistry: variability, trends and vulnerability) is a 4 year project funded under the Marine Research Programme 2014-2020, and runs from February 2017 to January 2021 (PI Dr Rachel Cave, NUIG). The aim of this project is to address some of the current gaps in our knowledge of the vulnerability and variability of selected marine ecosystems in Irish waters to ocean acidification (OA), by exploring some of the complex biogeochemical processes occurring at fine scales in selected ecosystems, and by studying the larger scale biogeochemistry of ocean waters impinging on those ecosystems. The objective with the collaboration with the CoCoHaCa 2 survey is to look at the chemical makeup of the different water masses within the submarine canyons of the Porcupine in terms of dissolved inorganic carbon, total alkalinity, dissolved oxygen and nutrients, from there we can devise the potential implications ocean acidification could have on submarine cold water corals.

The Porcupine Bank Canyon, in Irish waters 370 km SW of Mizzen Head, is disconnected from terrigenous influences being isolated from river and across shelf sediment/watermass influences. Unlike all other European submarine canyons, the Porcupine Bank Canyon and its smaller neighbours, represent a natural laboratory for studying oceanographic changes unimpaired by changes in the terrestrial (human dominated) environment. Significant deep-sea exploration and surveying has established baseline data revealing a major carbonate-dominated upper canyon system (RTE 9 O' Clock News, 16th July 2015) hosting extensive heterogeneous cold-water habitat cover.

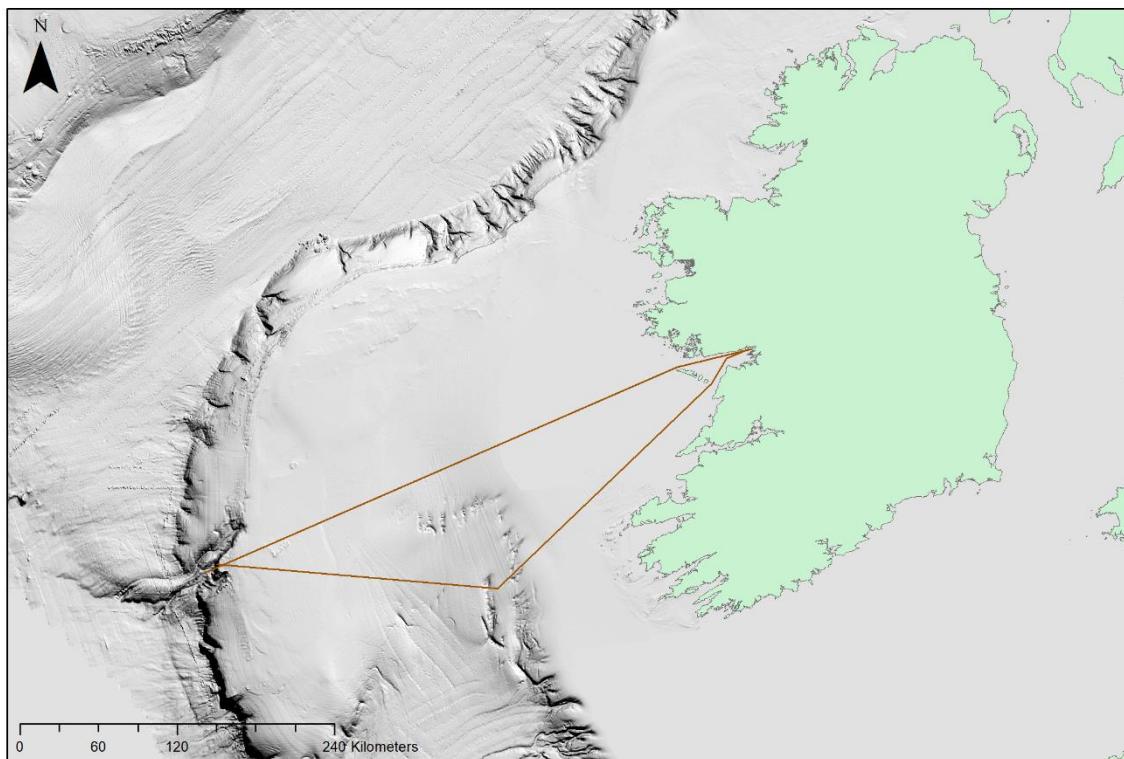

Survey Objectives and Cruise Track

The research cruise has a number clearly-defined scientific objectives:

1. **Local-scale, high-resolution mapping:** The shallow-water EM2040 multibeam echosounder will be integrated on the Holland 1 ROV (technique has been tried and tested on preceding CoCoHaCa I and QuERCI I surveys, 2015 and 2017 respectively) with a real-time sound velocity probe, an IXSea INS (Inertial Navigation System) and RDI workhouse DVL (doppler velocity logger). The ROV will be flown at approx. 100 m off the bottom to achieve a swath of approx. 300 m at a resolution of ~1 m. Survey lines will overlay previously existing ROV-video lines throughout the canyon (from canyon base to canyon summit and along the canyon head/lip). All data will be acquired and managed via SIS (Seafloor Information System) saved as *.all files. Data will be processed online using Fledermaus Qimera.
2. **Regional-mapping:** Using the hull-mounted EM302 multibeam echosounder, complete mapping coverage of the 10m canyon bathymetric and backscatter grid will be completed (existing coverage from QuERCI surveys is incomplete). Initially, a sound velocity profile of the water column will be taken using a sound velocity probe. This will calibrate the EM302 beams for the sound-speed variations specific to the canyon. The area will be surveyed typically parallel to contour lines over the canyon ensuring a minimum of 25% line overlap. All data will be acquired and managed via SIS (Seafloor Information System) saved as *.all files. Data will be processed online using Fledermaus Qimera.
3. **Water sampling and CTD's:** A series of water samples will be taken via the Niskin bottles on the CTD rosettes and Niskin bottles stored within the ROV bio-boxes. On the CTD rosette, bottles will be fired below the mixed layer, 500 m water depth, 100 m above the coral habitat zone, every 100 m through the coral habitat zone, 100 m below the coral habitat zone and near the benthic boundary layer. The bottles in the ROV bio-boxes will be fired when within a coral habitat. Once onboard samples will be filtered for particulate organic matter and treated with various chemicals to test for dissolved oxygen (DO), dissolved inorganic carbon (DIC), nutrients and salinity. CTD casts will be taken with the CTD rosette at various locations throughout the canyon and with the ROV during its to the bottom (for SVP calibration of the ROV-mounted multibeam) during lines and on ascent to the surface.

4. **ROV Vibrocoring:** Using the ROV-vibrocoring, the ROV will navigate to areas of known coral occurrence (based on previously collected video data) and target specific parts of coral mounds, off-mound areas, on the canyon lip and canyon base. Ten vibrocores will be taken at a time (typical of the Holland 1 ROV). Cores will be taken on board, labelled accordingly and stored at 4°C.

5. **ROV video and sampling:** Using the EM302 data acquired during this survey, we will ground truth coverage with video and opportunistic sampling of corals and associated organisms. High Definition video data will be acquired and stored as *.mov files (Quicktime format). ROV samples will be retrieved via ROV manipulator arms and stored within the bio boxes until recovery to surface. These samples will be stored in a solution of 97% ethanol or 70% ethanol and 30% seawater.

Cruise transit map

Equipment

RV Celtic Explorer

The RV Celtic Explorer is a 65.5 m multi-purpose research vessel. The vessel has wet, dry and chemical laboratories, which are permanently fitted with standard scientific equipment and can accommodate 20-22 scientists along with 13-15 crew who are highly skilled with the handling and deployment of scientific equipment. It has a maximum endurance of 35 days. The Celtic Explorer is equipped with two Trimble 300-D GPS' and has Dynamic Positioning. The aft deck has a 25 tonne "A-frame" with a 4 m outward and inward reach in addition to a 3 m, 10 tonne starboard T-frame. The ship also comprises of a midship, forward and aft crane as well as a 6 tonne CTD winch.

The RV Celtic Explorer

Holland 1 ROV

The Holland 1 ROV (remote operated vehicle) is a platform for capturing underwater remotely-sensed data of the seabed and transmitting this data as a live feed to the scientists aboard the vessel. It is depth-rated to 3000 m and has 100 hp with a maximum speed of 3 knots. An EM2040 multi-beam echo sounder is mounted on the vehicle for high-resolution bathymetric mapping of the seabed. The EM2040 operates at 200 - 400 kHz and is effective to 600m. The Holland 1 also has a HDTV camera, low resolution cameras and a HD digital stills with laser ranging scales. It is also fitted with a CTD and 2 robotic arms for sampling (1X7F and 1X5F) as well as an aspirator.

The Holland 1 ROV

Kongsberg EM2040 Multibeam Echosounder

The Kongsberg EM2040 multibeam echosounder is a high-resolution sonar with wide-band composite transducers which can operate at 3 frequencies (200 kHz, 300 kHz, and 400 kHz), non-simultaneously. It is depth-rated to 6000 m. For this cruise, it is mounted on the Holland 1 ROV and integrated with a sound velocity probe, Sonardyne USBL, DVL and IXSea Inertial Navigation System. Acquisition is planned and managed via Kongsberg's Seafloor Information System (SIS) where it will be flown at approx. 100 m off the bottom at 200 kHz and at a survey speed of 0.4 knots.

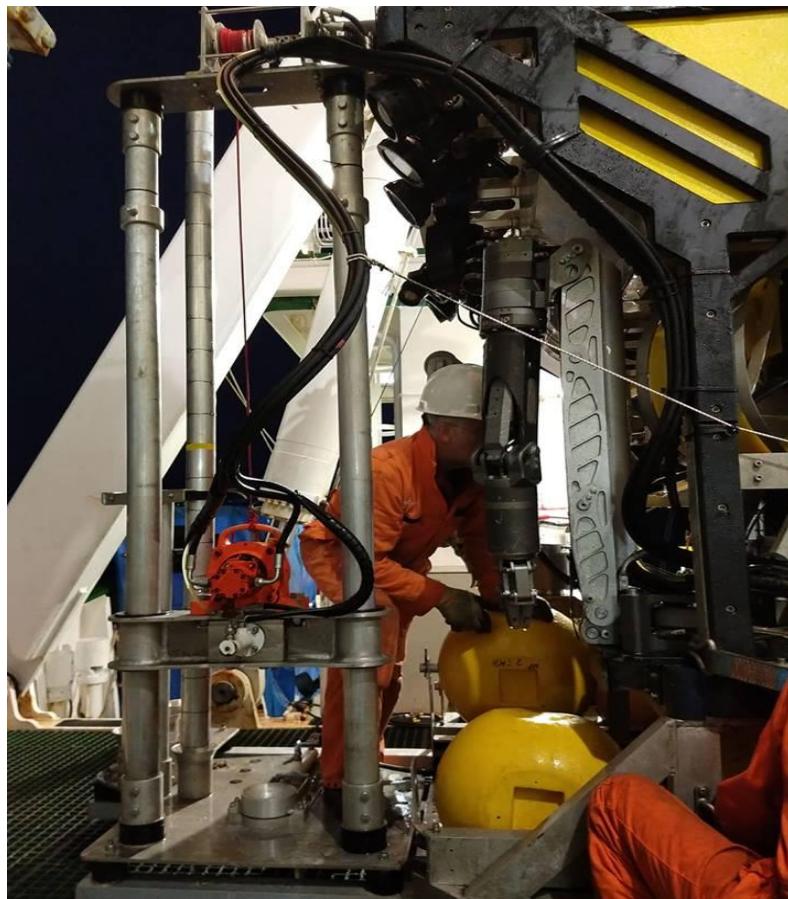

Kongsberg EM2040 mounted on the Holland 1 ROV

Kongsberg EM302 Multibeam Echosounder

The Kongsberg EM302 multibeam echosounder is deep-water sonar which operates at 30 kHz achieving an 8,000 m water depth range. It is mounted at the hull of the RV Celtic Explorer (not on the drop keel). It is integrated with a sound velocity probe, C-Nav navigation, a motion reference unit and a dedicated processing unit. All acquisition and planning is carried out in SIS.

ROV Vibrocoring

The MBARI Vibrocoring rig is designed to retrieve core samples from water-saturated sediment from an ROV. This means targets can be accurately positioned both by USBL and visual observation. The corer can be vibrated at a range of frequencies which allows it to penetrate soft sediment on the seabed with minimal disturbance. The vibrocoring rig was developed by MBARI and fixed to the front of the ROV. Up to 5 core barrels can be stored on the rig and are loaded by the ROV manipulator arms.

The Vibrocoring rig mounted on the ROV

CTD Rosette

A Sea Bird Electronics SBE 911 plus CTD was used to measure variations in a variety of parameters in the water column. The CTD was fitted with the following sensors: SBE 35 Digital Thermometer, a SBE44plus conductivity sensor, a Digiquartz pressure sensor, a SBE 43 dissolved oxygen sensor, altimeter, fluorometer and a nitrogen saturation sensor.

CTD rosette on deployment

Survey Log (UTC)

Galway

July 28th 2018

Mobilisation commences. Rockdrill not operational and is cancelled for the cruise. EM302 will not ping and cannot load background information. Restarted SIS and restarted computer. Informed technicians and ran SIS BIST test (passed). SIS pinged temporarily. Problem persisted.

Galway - Galway Bay

July 29th 2018

0505 Tie off and steam to Galway Bay (off Rossaveal). The EM302 (**0820**) would still not ping. Technicians and they ran a BIST (passed). Restarted the Processing Unit (PU) and the problem persisted). At **0915** technician is taking out EM302 power supply to put back in 1.5 hours later. **1200** EM302 power supply put back and tested but the problem remains. Run BIST (failed). To be tried again in deeper water >100 m (currently at 47 m). **1500** scientists fine-tuning the water chemistry, water filtering and CTD workflow. Multibeam calibration and patch test at **1600**. Noticed cross swath striping in the data during calibration, confirmed after processing the data. ROV crew required to take hours of rest (**1900**). ROV tech, Colin Ferguson, joined vessel (**2005**).

July 30th 2018

Steamed to 100 m water depth outside Galway Bay (**0100**) to trial the EM302 in deeper water and run BIST test (pass). ROV deployed at **0930** for multibeam testing. On processing, ROV multibeam data remained "striped". Chief ROV technician is liaising with Kongsberg regarding the issue. Applying various changes to ROV EM2040 installation parameters (**1000 - 2000**). ROV recovered to deck (**2000**). The multibeam data striping appears to as a result of the IXSea INS depth feed not being smoothed. Decided to stay in Galway Bay to apply to bypass the depth feed directly to the multibeam.

July 31st 2018

The ROV goes back in the water to test the new depth feed (**1100**). At **1230**, ROV back on deck and Chief ROV technician decided that the fix was not effective. The plan at this time is to review the MBES-INS integration on transit after IXSea respond whether to proceed with ROV-

MBES later in the cruise. Informed the bridge at **1240** of our intent to steam to the survey area with a view of completing a USBL calibration.

Galway Bay - Porcupine Bank Canyon

July 31st 2018

Leave Galway bay testing area to steam to target site (**1400**).

August 1st 2018

ROV stops on transit to trial the new depth feed for the EM2040 (**1530**). Multibeam data showed a roll error. Sent sample of data to Kongsberg. Start on transit again to the canyon (**1800**).

Porcupine Bank Canyon

August 1st 2018

Arrival at the Porcupine Bank Canyon at **20:30**. **Station 1** is an ROV Dive (**Dive 1, Station 1; CE18011_1**) at the south eastern flank of the canyon where the ROV is tested. ROV multibeam data does not show any significant errors and ROV is recovered to deck. ROV **Dive 2 (Station 2; CE18011_2)** is at **2355** to cover pre-existing ROV-video data (Line 1). The EM2040 is operated 400 kHz, 100 m off the bottom. Processing of the raw data shows that there are no significant roll-like artefacts.

August 2nd 2018

Dive 2 ends at **0623** (ROV on deck). Transit to start of next line. ROV in water for **Dive 3 (Station 6; CE18011_6)** at **0735**. On route down, ROV CTD stopped at approx. 635 m water depth and restarted (saved as 2 files). EM2040 data acquired for **Dive 3** (Line 2). Noticed some minor roll artefacts on processing. This appears to be related to tension on the ROV umbilical. Near the end of the line, the connection with the EM2040 sonar head was lost. ROV recovered to deck (**1503**). Steamed towards the next survey line. ROV in water for **Dive 4, station X (Line 3)** at **1655**. On ROV decent, the CTD cast recorded anomalous data values and was therefore cut into 3 separate files which are converted to a single SVP. EM2040 recorded data for Line 4, up canyon face, through coral habitable zone to beyond the canyon lip. ROV recovered to deck (**2140**). At next station (**Line 4, Dive 5**) and ROV in water at **2218**. EM2040 recorded data for Line 4, up canyon face, through coral habitable zone to beyond the canyon lip.

August 3rd 2018

ROV back on deck at **0552**. Logged hull-mounted EM302 on transit to next station. ROV in water at the next station for **Dive 6 (CE18011_15; Line 5)** at **0636**. ROV on deck and move to next station at **1110**. ROV in water for **Dive 7 (CE18011_16; Line 6)** at **1152**. EM2040 recorded data for Line 4, up canyon face, through coral habitable zone to beyond the canyon lip. ROV back on deck at **1541** and steam for next station. ROV in water at next station (**CE18011_17**) for **Dive 8 at 1630**. EM2040 recorded data for Line 4, up canyon face, through coral habitable zone to beyond the canyon lip. ROV back on deck at **2114** and steam for next station. ROV in water at next station (**CE18011_19**) for **Dive 9 (Line 8)** at **2144**. EM2040 recorded data for Line 4, up canyon face, through coral habitable zone to beyond the canyon lip.

August 4th 2018

ROV back on deck at **0527** and steam to next station. ROV on station (**CE18011_23**) for **Dive 10** to acquire an ROV multibeam grid of the south eastern canyon flank and margin.

August 5th 2018

ROV multibeam grid complete and ROV back on deck at **0106**. Transit to next station (**CE18011_26**; hull-mounted EM302 multibeam grid). Acquire hull-mounted MBES throughout the canyon until **1350**. **Dive 11** starts for ROV vibrocoring at **1450** on the top of a coral mound above the south eastern canyon flank. The first vibrocore (**VC1**) was retrieved on the top of a coral mound at **1528**. **VC2** was retrieved off-mound at **1629**. **VC3** was retrieved off-mound at **1730**. **VC4** was retrieved from a coral garden at **1925** and **VC5** was also retrieved from a coral garden at **1937**. **Dive 11** ends and ROV back on deck at **2003** to recover the cores. ROV back in water for **Dive 12 at 2130** to continue the vibrocoring transect. **VC6** was retrieved at **2223** from near the centre of the canyon deep.

August 6th 2018

VC7 was retrieved from the pro-slope of the canyon at **0015**. **VC8** was retrieved from the canyon lower slope (coral talus slope deposit) at **0255**. **VC9** was retrieved from the upper-mid canyon slope (coral talus slope deposit) at **0337**. The Vibrocoring rope snapped during acquisition of **VC9** and the remainder of the dive is abandoned. ROV back on deck at **0428**. Vessel moved to start of Hull-mounted EM302 survey grid (**CE18011_40**) at 0456. Acquired data on this grid until **1421** when the ROV is deployed back in water for **Dive 13** (video, water and bio-sampling). The ROV acquired video, CTD, bio-samples from the lower canyon segment to the south east. The ROV was back on deck at **2300**.

August 7th 2018

Started hull-mounted EM302 multibeam grid to map the canyon (**CE18011_60**) at **0020**.

August 8th 2018

Hull-mounted EM302 multibeam grid complete at **0103** and steam to first CTD station (**CE18011_61**; **CTD cast 1**) to arrive at **0508**. **CTD cast 2 (CE18011_62)** is complete at **0752**. **CTD cast 3 (CE18011_63)** is complete at **0916**. **CTD cast 4 (CE18011_64)** is complete at **1132**. **CTD cast 5 (CE18011_65)** is complete at **1252**. **CTD cast 6 (CE18011_66)** is complete at **1537**. **CTD cast 7 (CE18011_67)** is complete at **1736**.

Porcupine Bank Canyon - Northern Porcupine Seabight - Galway Bay

August 8th 2018

Steamed for north Porcupine Seabight multibeam line directly after (**1736**). Arrive on station (**CE18011_68**) at **2241**.

August 9th 2018

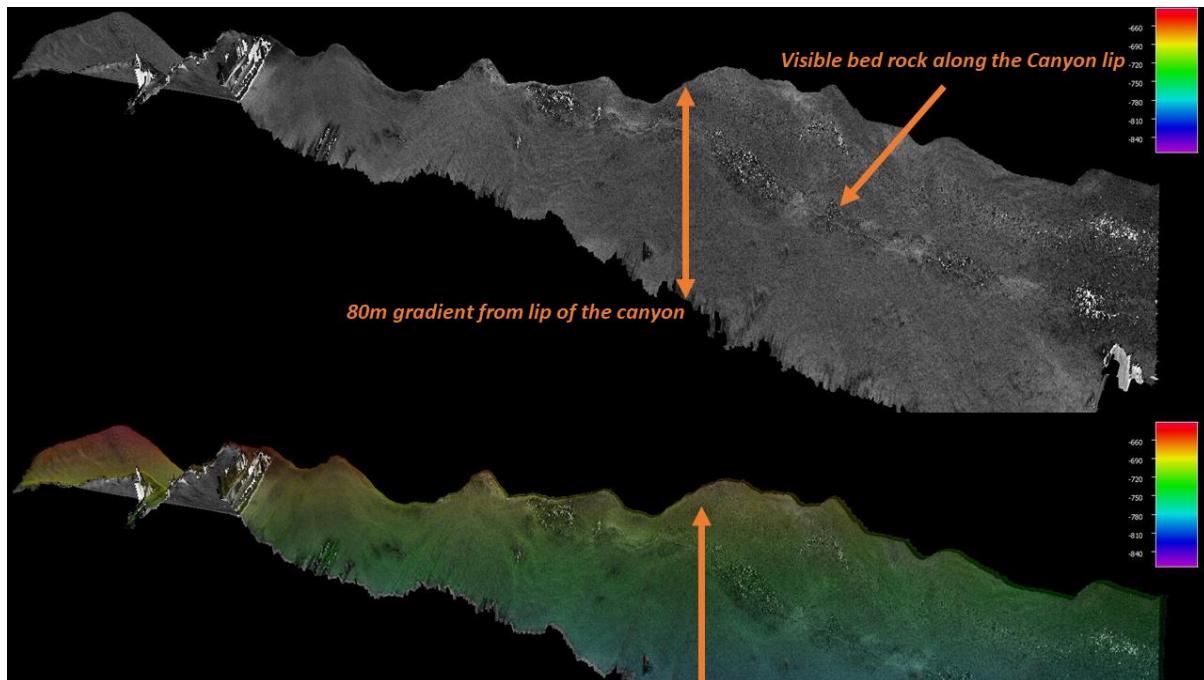

Line complete at **0923** and commence transit to Galway Bay.

August 10th 2018

Dock at **0400**. Survey ends.

Results Summary

Local Scale, High Resolution ROV-mounted EM2040 multibeam data

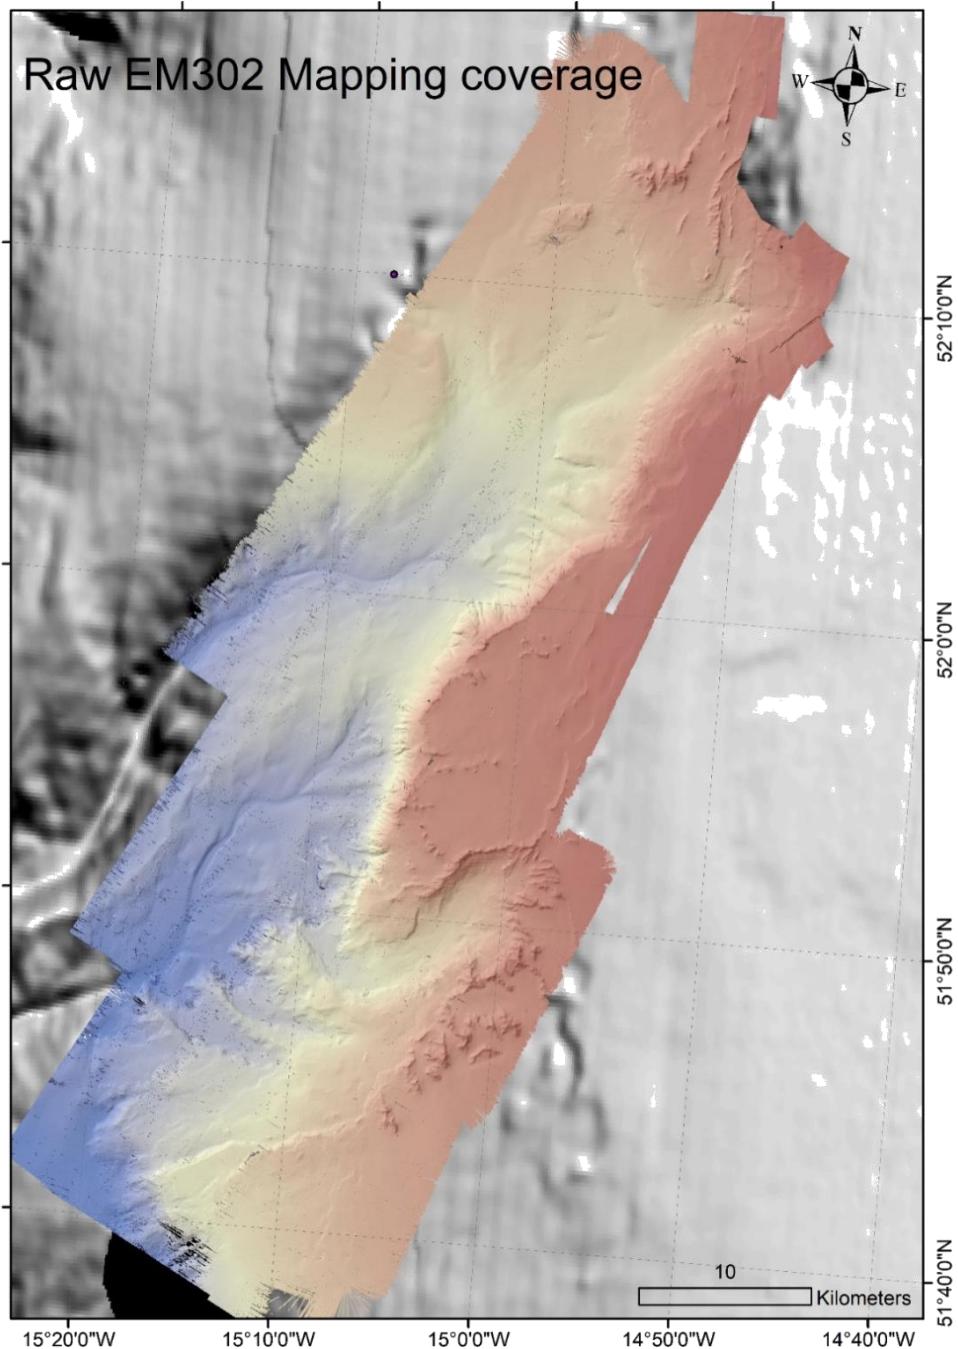

Sample raw ROV-mounted EM2040 backscatter and bathymetry data.

ROV-mounted multibeam data were acquired throughout the canyon as; a) a series of lines previously imaged by video and; b) as a grid through an area of interest. The lines extend through the coral habitable zone of the canyon (approx. -1000 m to -600 m), crossing the canyon base, up the canyon wall and over the canyon lip (see ROV multibeam dive map). These lines show the canyon face is steep (approx. 35 degree slope) and is covered by sediment, bedrock exposure and biogenic structures. On the lip, the coral mound features grow to >20 m in height above the canyon lip and appear to coalesce along the full later extent of the canyon lip.

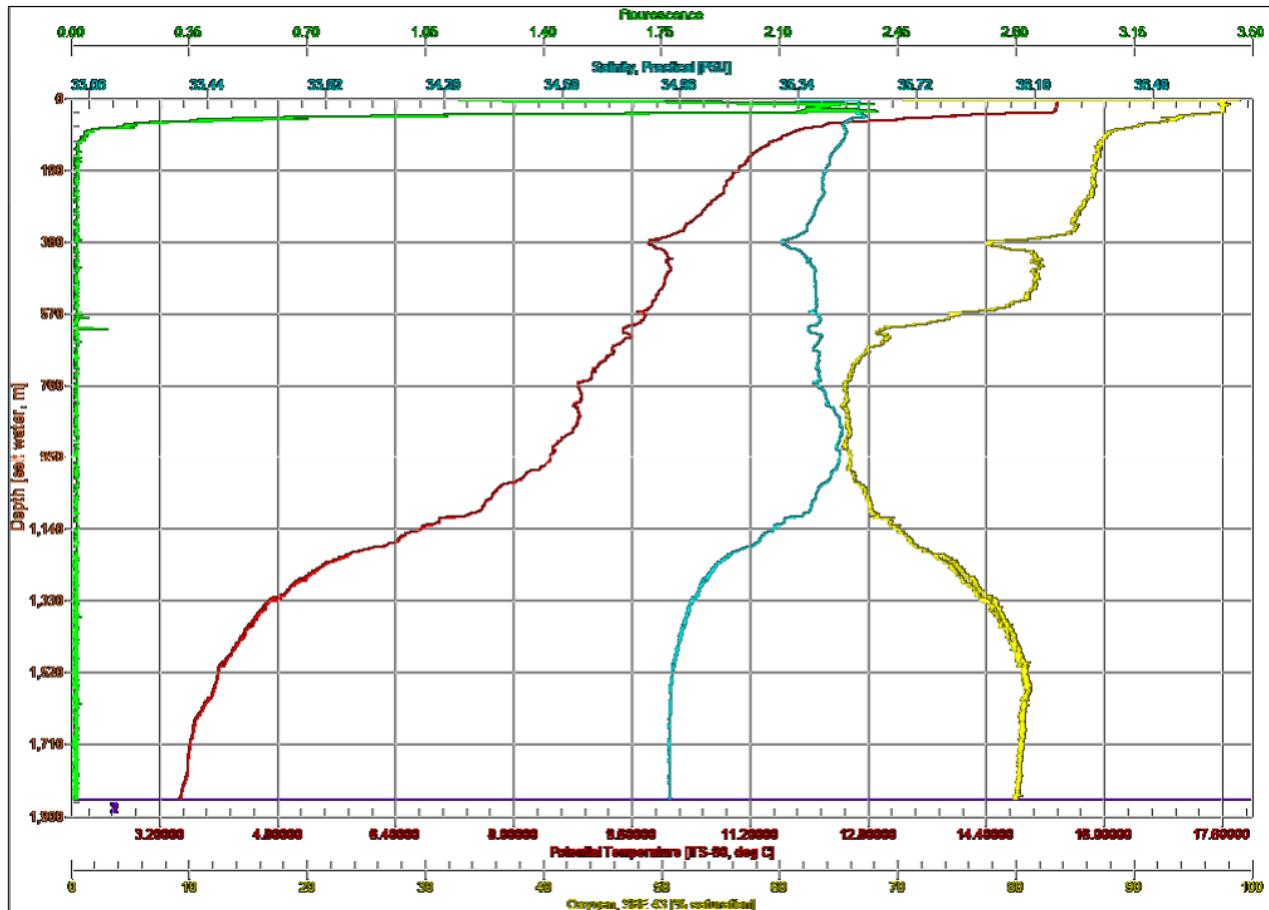

Regional-scale EM302 multibeam data

Porcupine Bank Canyon

Hull-mounted EM302 multibeam data covers an area of approx. 1,800 km². The bathymetric data reveals a near vertical 700 m high canyon flank (-600 m to -1300 m). The canyon flank has a 30 m tall lip which appears to be made of cold water coral reef. Further to the north these ridge features are smaller while towards the south, they have a propeller-like morphology and grow up to 200 m in height.

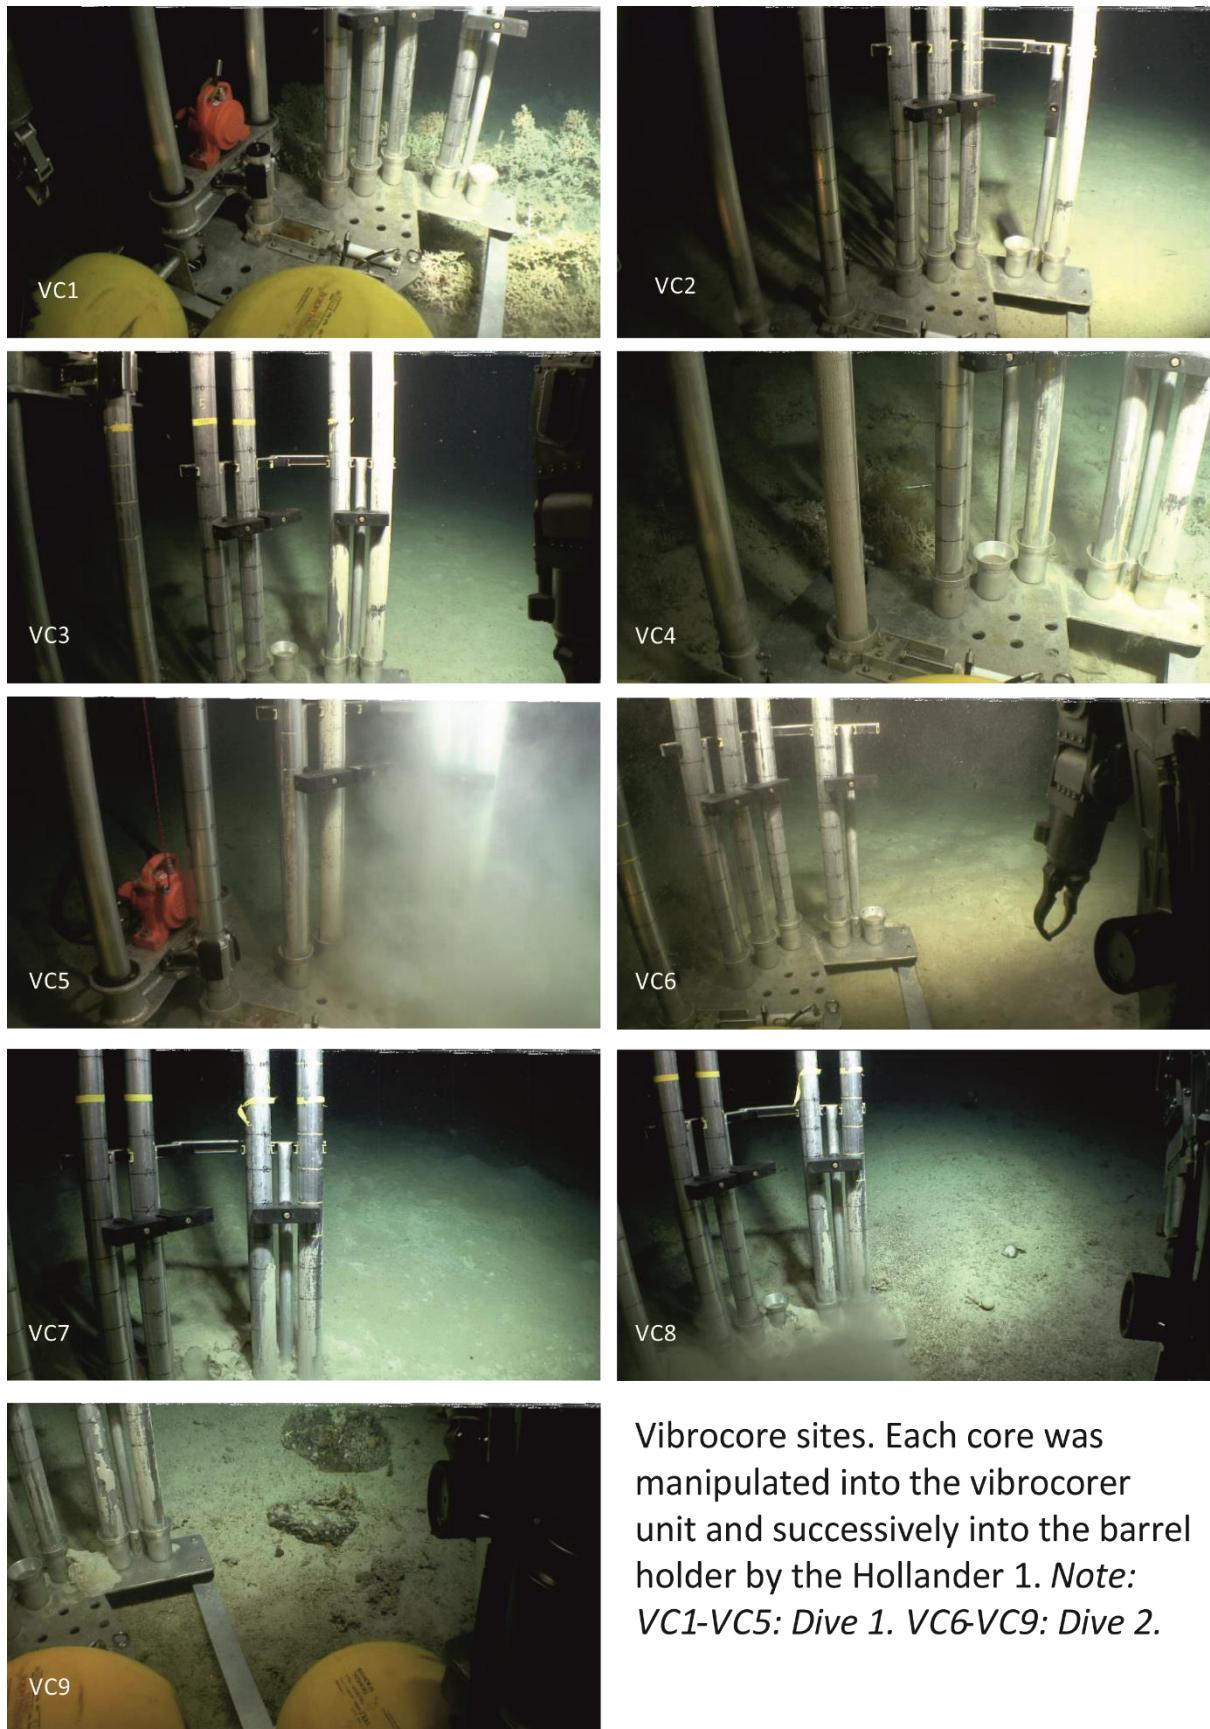

CTD profiles

Visual representation of raw conductivity, temperature and depth CTD data produced by the sensors on the SBE32 carousel

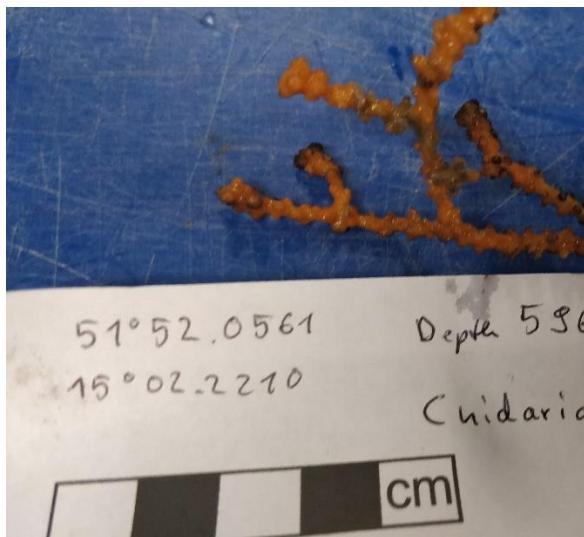

Typical CTD profiles from the canyon show a distinct obvious change in water masses, from the salinity and temperature, seen as blue and red respectively, once below the summer thermocline visible above 80 m. The first water mass present was Eastern North Atlantic Water ENAW which transitioned to Labrador Sea Water LSW at 1200 m. There is decrease in the percentage of dissolved oxygen, seen in yellow, within the coral habitable zone (600 to 1000 m).

ROV Vibrocores

ROV Video and Bio-samples

Several mounds were observed (Dive 13) on the lip and within the canyon from the multibeam data. The main purpose of the dive to groundtruth the observations made on the multibeam data. Sediment dwelling organisms such as *Holothurian* sp, *Cidaris cidaris*, white Galatheide sp, *Octopoda* sp, *Rajidae* etc., were observed in off-mound areas. The corals occur between 600 - 1000 m depths. Coral rubble and sparsely growing low-lying Lophelia/Madrepora were observed on the flanks of the mounds and actively growing dense aggregates of Lophelia pertusa at the summit. We also observed large stocks of fish (about 10 cm in length) on coral habitats, and squids mainly at off mound areas. Other commonly observed black corals include *Leiopathes* sp, *Antipathes* sp, *Bathyphathes* sp and *Stichopathes* sp. Sponge species observed were *Hexedella* sp and *Aphrocallistes beatrix*. The presence of fishing lines at 1123 m water depth evidenced fishing activities in the canyon despite the fact that the Porcupine Bank Canyon is designated as Special Area of Conservation (SAC). However, these lost lines served as substrate for certain unidentified coral species (Figure 1). Several other biological samples were collected for further analysis during the video dive. Collected samples were stored in 70% ethanol on board.

Unidentified Cnidaria sp sampled for further taxonomic analysis

Anthomastus sp

Antipathes sp and associated crinoid sp

Dense lophelia coverage along the canyon lip

CE18011 Cruise Report: Controls of Cold-Water Coral Habitats in Submarine Canyons (CoCoHaCa II)

Core	Dive	Station	Lat	Long	Depth (m)	Length (m)	Comment
VC1	11	28	51°58.9729	14°59.9719	660	1.43	Coral mound east of canyon lip. Slight loss of sediment from core catcher during acquisition. Rig lifted during drill, inhibiting >1.4m to be retrieved. Light brown/greys visible in cores. Coral pieces in bagged sample.
VC2	11	29	51°58.9306	15°00.4519	731	0.8	Off mound setting. Homogenous sediments. Lost some sediments from bottom of core during acquisition. Top of core (0-10cmbf) composed of olive grey very fine sands and silts. 50-60 cmbf consists of a coarser orange-brown sand unit. 60-80 cmbf consists of orange-brown muds.
VC3	11	30	51°59.0103	15°00.8165	722	0.5	Off mound setting. Heterogenous sediments. Throughout succession of core, sediments are composed of very fine olive grey and orange brown units of sands and silts. Core catcher showing sandy contents and minor black angular sediments
VC4	11	31	51°59.0804	15°06.5420	671	1.8	Coral garden 1. Large pieces of Lophelia (<4cm) present in top of core. 0-40cmbf and 50-180cmsf composed of olive grey muds and silts. At 40-50cmbf, coarser sand unit noted. At base of section (i.e 180 cmbf), bagged sample composed of white calcareous muds.
VC5	12	32	51°59.0481	15°01.4890	699	1.23	Coral garden 2. Directly at boundary between coral mound and bank sediments. Sediment leakage from top of core during acquisition. At depths of 160 cm, very resistant. Core showing 0-30cmbf composed of light brown muds. From 30-70cmbf, orange brown sands fine downwards. 75-120cmbf composed of yellow-brown muds.
VC6	12	35	52°00.8461	15°02.2188	1857	0.5	Deep sea setting. Hit consolidated layer/object at 0.7 m. 0-40 cmbf consisting of olive grey muds with traces of black and orange mottling. At 40 cmbf sediments progress into coarser sands and shelly hash until the remainder of the core. High biogenic component present.
VC7	12	36	52°00.1980	15°01.9231	1716	0.13	Pro-slope locality. Sediment vented extensively through core during vibrocoring. In the core, at 13cmbf, sediments are composed of olive grey muds which darken upwards to dark grey muds.
VC8	12	37	51°59.7397	15°01.5749	1202	0.33	Tallus slope locality 1. Cored at change in water mass according to ROV CTD unit. Core showed a fining upwards sequence. In 33-20 cmbf sediments were coarse with high biogenic content. 20-5 cmbf was relatively finer with a similar sedimentary content. Video footage showed large tallus deposits (>4cm) on the surface.
VC9	12	37	51°59.4185	15°01.3343	902	0	Tallus slope locality 2. ~22 m NW downslope from ledge. Hit hardground within first 10 cm of acquisition. Sediments were bagged when ROV returned to surface due to the insufficient amount retrieved.

16.00: Wind SW, Force 7, moderate sea & swell

20.10: Wind SW, Force 6-7, rough sea, rain, poor visibility

21.52: Wind SW, Force 6

23.51: Wind SW, Force 6

1st August - Transit & Porcupine Bank Canyon

02.00: Wind SW, Force 5, moderate sea & swell

04.00: Wind SW, Force 5, moderate sea & swell

07.55: Wind SSE, Force 5-6, moderate sea & swell

10.57: Wind SSW, Force 5

12.01: Wind SSW, Force 5

14.00: Wind SSW, Force 4, slight sea & swell, good visibility

16.00: Wind SSW, Force 4, slight sea & swell, fog, poor visibility

20.00: Wind SW, Force 4-5, slight sea, moderate visibility

23.55: Wind SW, Force 4

2nd August- Porcupine Bank Canyon

02.00: Wind S, Force 3, calm seas, good visibility

04.00: Wind S, Force 3, calm seas, good visibility
08.00: Wind S, Force 2-3, slight sea, poor visibility
12.10: Wind SW, Force 3, calm seas
14.00: Wind SW, Force 3, calm seas, fog, poor visibility
16.15: Wind SW, Force 3, calm seas, fog, poor visibility
20.00: Wind W, Force 2-3, calm seas, good visibility
22.44: Wind SSW, Force 3
23.58: Wind SSW, Force 3

3rd August - Porcupine Bank Canyon

02.00: Wind W, Force 3, calm seas
04.00: Wind W, Force 3, calm seas
08.00: Wind SW, Force 2-3, slight seas, good visibility
14.00: Wind light variable, Force 3, calm seas and swell, good visibility
16.00: Wind NW, Force 2, calm seas, good visibility
20.05: Wind WSW, Force 2-3, slight sea, good visibility
21.29: Wind NNW, Force 3
22.00: Wind NW, Force 4
23.55: Wind NW, Force 3

4th August - Porcupine Bank Canyon

02.00: Wind W, Force 3, calm seas, good visibility
04.00: Wind W, Force 3, calm seas, good visibility
07.55: Wind light variable, calm seas, good visibility
12.00: Wind SW, Force 3
14.00: Wind SW, Force 2, calm seas, cloudy, good visibility
16.00: Wind SW, Force 2, calm seas, cloudy, good visibility
20.00: Wind SW, Force 2, calm seas, good visibility
23.58: Wind SW, Force 4

5th August - Porcupine Bank Canyon

02.00: Wind SSW, Force 3, calm seas, good visibility
04.00: Wind SW, Force 3, calm seas, good visibility
08.00: Wind SW, Force 5, slight sea, good visibility
10.45: Wind SW, Force 5
12.00: Wind SW, Force 5
14.00: Wind SSW, Force 4, slight/moderate swell, good visibility
20.00: Wind SW, Force 4-5, moderate sea, poor visibility
21.25: Wind SW, Force 5, fog
23.55: Wind SW, Force 5

6th August - Porcupine Bank Canyon

02.00: Wind W, Force 3, calm seas, good visibility
04.00: Wind W, Force 3, calm seas, good visibility
08.00: Wind W, Force 5-6, slight/moderate sea, rain, poor visibility
10.54: Wind W, Force 5, calm seas

12.05: Wind SW, Force 4
14.00: Wind W, Force 5, calm seas, cloudy, good visibility
16.00: Wind W, Force 4, calm seas, slight swell
20.00: Wind W, Force 4, slight sea, good visibility
22.41: Wind SW, Force 5
23.37: Wind W, Force 5-6, 21-25 kts

7th August - Porcupine Bank Canyon

02.00: Wind W, Force 5, slight/moderate sea, good visibility
04.00: Wind W, Force 5, moderate sea, good visibility
08.00: Wind W, Force 6-7, moderate sea, good visibility
11.00: Wind W, Force 6
11.56: Wind NWN, Force 7
14.00: Wind W, Force 6-7, moderate sea and moderate swell, good visibility
16.00: Wind W, Force 6-7, moderate sea and swell
20.00: Wind WNW, Force 6-7, moderate sea and swell, moderate visibility, occasional rain
22.10: Wind NW, Force 6
23.38: Wind NW, Force 5
23.54: Wind NNW, Force 6

8th August - Porcupine Bank Canyon to northern Porcupine Seabight

02.00: Wind NW, Force 5, moderate sea and swell, good visibility
04.00: Wind NW, Force 5-6, moderate sea and swell, good visibility
08.00: Wind NW, Force 4, moderate sea and swell, good visibility, occasional rain
09.25: Wind NW, Force 5
11.41: Wind NW, Force 5
12.00: Wind WNW, Force 5,
13.49: Wind SW, Force 3, calm seas, partly cloudy, good visibility
16.00: Wind SW, Force 3, calm seas, partly cloudy, good visibility
20.00: Wind W, Force 4, slight sea and swell
22.28: Wind WNW, Force 5
23.56: Wind W, Force 4

9th August - Northern Porcupine Seabight to Galway Bay

02.00: Wind WNW, Force 5, moderate sea, good visibility
04.00: Wind WNW, Force 5, moderate sea, good visibility
08.00: Wind W, Force 3-4, slight sea, good visibility
08.37: Wind W, Force 4
12.05: Wind W, Force 4
14.00: Wind NNW, Force 3, calm sea and slight swell, partly cloudy, good visibility
16.00: Wind W, Force 3, calm sea and slight swell
20.00: Wind W, Force 3, slight sea, good visibility
21.09: Wind WNW, Force 4
22.06: Wind W, Force 4
23.59: Winds light variable, sheltered, good visibility

9th August - Galway Bay to Galway Dock

02.00: Winds light variable, calm sea, good visibility

03.54: End of survey
